

## Watch out for pedestrians, cyclists, and loose animals on the road.

As we set out to drive, we all expose ourselves to unforeseen events and risks that may arise on the road.

Pedestrians, cyclists and loose animals are some of them, and we must be very attentive to their movements.

Nowadays, the number of cyclists and pedestrians has increased due to the pandemic, so drivers must pay more attention to these new mobility factors.

On the other hand, loose animals constitute a risk due to their unexpected behavior, which could easily cause an accident.

### What should you do to reduce these unforeseen events?

- Carry out regular visual sweeps and pay special attention to the roadway and sides of the road.
- Slow down in places where there is increased mobility.
- Respect and adapt your speed in areas where signs indicate the presence of animals, schools, pedestrian paths or cyclists.
- Keep a distance of at least 1.5 m when you pass by a cyclist.
- Try to anticipate the actions of pedestrians, cyclists, and even of the animals that you see on the road.
- Increase attention at crossings and intersections.
- Sharpen your attention in places with low or no visibility.
- At night, cyclists, pedestrians and loose animals are less visible; increase your attention accordingly.
- Do not use your cell phone while driving or perform actions that distract you or take your eyes off the road.
- Keep your hands on the wheel for greater control of the vehicle in case you need to make a sudden maneuver.

In general maintaining your attention on your driving, the road and its surroundings, keeping your speed appropriate to the circumstances of the road, the weather, traffic and traffic signs, are actions that collaborate to reduce risk.

**Driving demands responsibility and respect from everyone that takes part in mobility.  
Be a safe driver, we are counting on you!**
